# 8. Experiment: User Management & RBAC in Zoho Creator

> **Aim:** To configure granular User Management and Role-Based Access Control (RBAC) within a Hotel Room Booking application in Zoho Creator to secure room allocation modules, restrict guest data visibility, and assign designated operational staff roles.

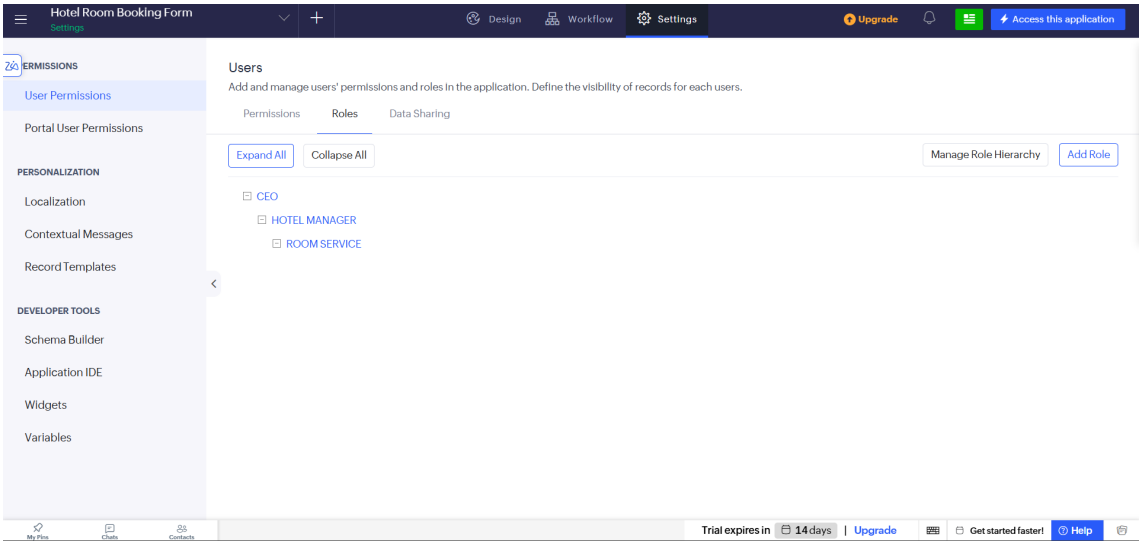

## WORKFLOW

Role-Based Access Control restricts system access based on the organizational role of a hotel staff member. In this lab, we configure an enterprise Hotel Management application in Zoho Creator featuring three distinct user tiers:

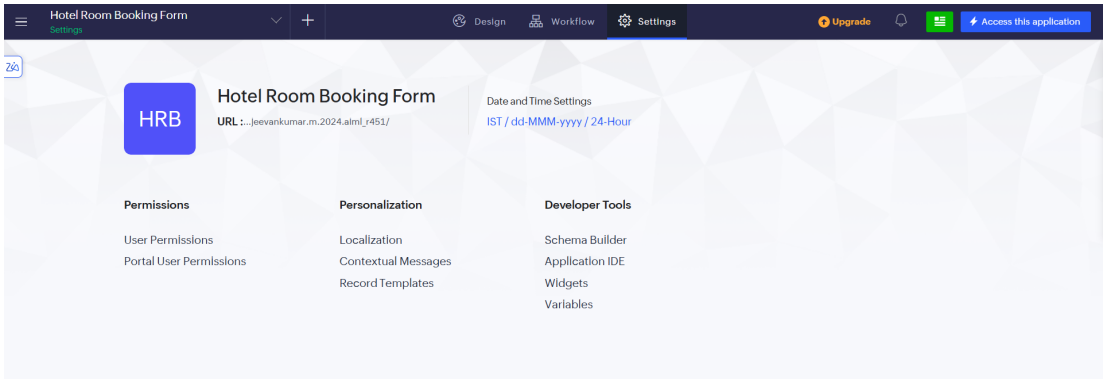

| Role Name | Assigned Permissions | Data Access Scope |
|---|---|---|
| **General Manager (Admin)** | Full Create, Read, Update, Delete (CRUD) | All guest records, room tariffs, financial reports across the property |
| **Front Desk Manager** | Read, Update, Approve Reservations | Assigned branch / department booking records and check-in schedules |
| **Reception / Staff** | Create & Read own submissions | Only self-created guest check-ins and room service requests |

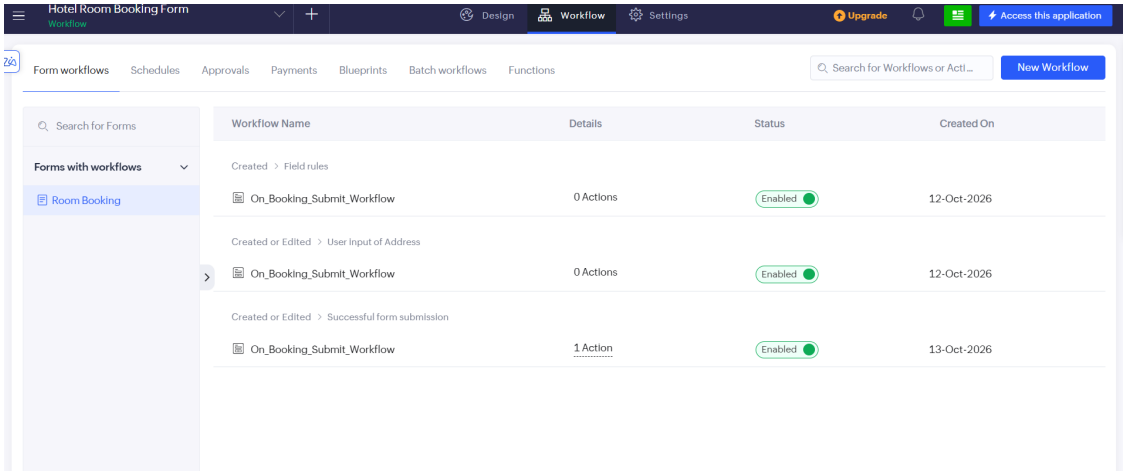

## PROCEDURE

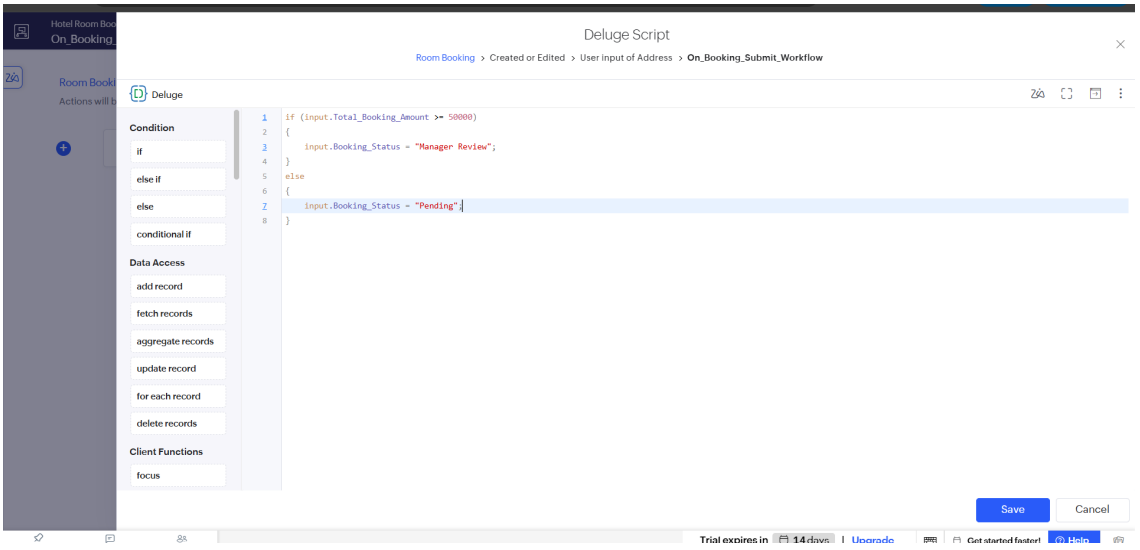

1. **Access Developer Mode:** Log into Zoho Creator, open your *Hotel Room Booking Application*, and navigate to the **Settings** tab in the left-hand builder menu.
2. **Configure Users & Roles:** Click on **Users & Permissions** under the Users section. Select the **Roles** sub-tab and create custom roles (e.g., Hotel Manager, Desk Executive) alongside the default Administrator role. Establish hierarchy reporting lines if required.
3. **Define Profiles & Permissions:** Navigate to **Profiles** to fine-tune module-level permissions (Room Booking creation, Occupancy Report viewing, Tariff Edit/Delete rights).

## SCREENSHOTS & VISUAL EVIDENCE

## RESULT

User management and RBAC rules were successfully configured and tested in Zoho Creator for the **Hotel Room Booking Application**, ensuring robust application security, guest data isolation, and structured multi-user workflow execution across administrative and front-desk personnel.
